

Pace clock 230-2D

Synchronized pace clocks

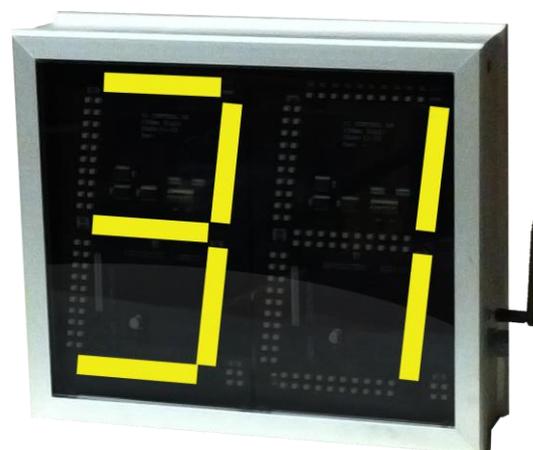

Our Pace clocks exists in several different versions where our 230-2D is the two digit version. It works alone as a single unit with only the power connected and it can also be connected into a system with several synchronized units.

With over 200 mm high numbers it is possible to see the scoreboard on about 100 m distance and with the help of the strong LEDs its clearly visible even in direct sunlight.

To provide optimal contrast in all conditions, even when not in direct sunlight it is, as all boards in the 230 series, equipped with a light sensor and automatically adapts the brightness of the LEDs to the sounding light.

When using the clock in a system with several units they can either be connected wirelessly or through cable as a system where one unit works as a master and sends the signal to the rest of the displays so that all shows the same time synchronized. This can be an important feature when using several clocks in viewing range of each other. No manual synchronizations is needed.

Through the possibility to combine the system with our 230-6D, 230-18D and TimeTemp display that all can switch between daytime, local temperature or pace clock the system is a perfect solution for a complete installation. Easy to install, easy to manage.

Technical Specification

Weight	5kg		
Power	230V / 50 Hz		
Hight of numbers	230 mm		
Viewing distance	Up to 100m		
Wierless Frequency	2,4 Ghz
